

# ***BRACKETT'S Pad Chiller Field Retrofit*** for your **Circular Padder**:

As a Circular Padder user, you already know the benefits of having the Brackett Circular Padder in your shop. Now you can expand the capabilities of your machine with this field modification - our **Pad Chiller** - built by Brackett and in use industry-wide.

The **Pad Chiller** *dramatically* reduces the set time for 'slower curing' adhesives. In addition, it solves the problem of lengthy cure-times when gluing thicker pads, allowing you to maintain the *high volume production* you've come to expect from your Brackett Circular Padder.

Our **Pad Chiller** consists of a small refrigeration unit and a custom-made water pan. After each pad passes over the glue roller, it receives a chilled touch of water to rapidly set the hot-melt glue. The unit can be switched on or off as needed and integrates seamlessly with the operation of your machine. The **Chiller** is pre-set to maintain the water pot at optimum temperature even during heavy, high speed usage. Also included are simple installation / set-up instructions and (as always) the full and friendly support of your Brackett Service Department, just a phone call away.

To add value to an already *invaluable* piece of equipment, click to place an order for our **Pad Chiller** - or call our service / sales department for more information.
